

AWS AMI CREATION

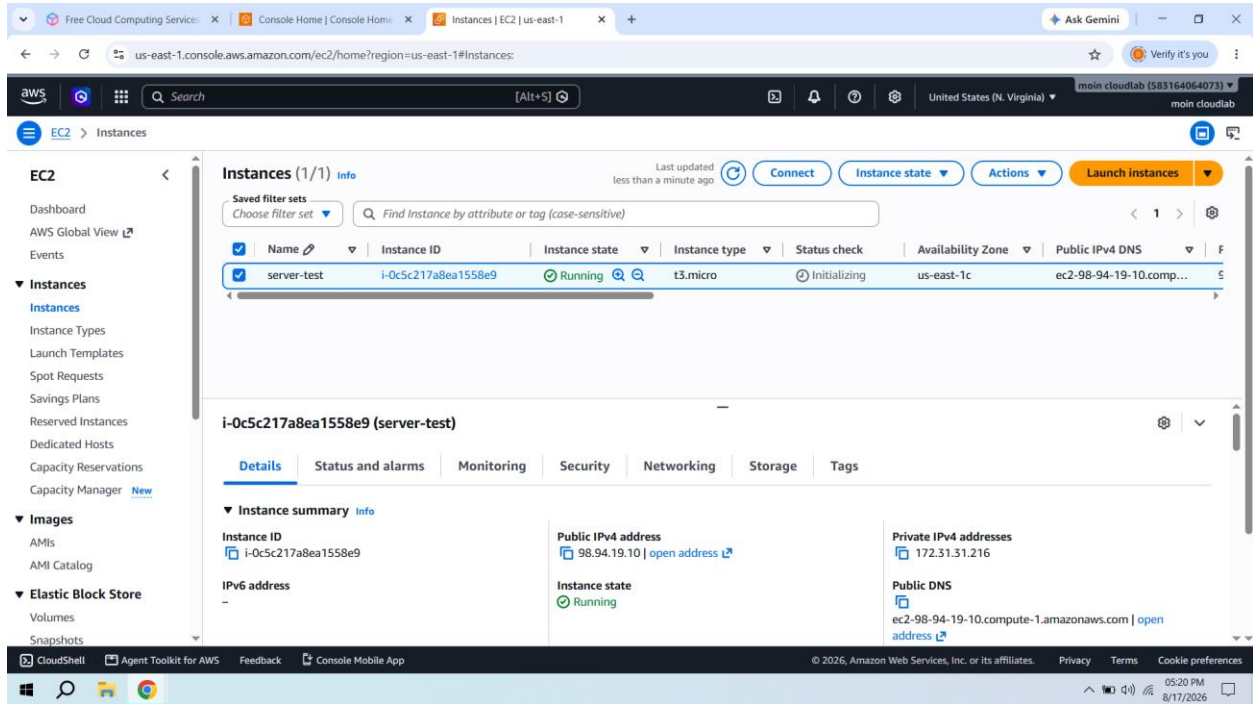

- Step to create ami image and host static website

Here is a breakdown of the workflow I implemented:

- **Instance Launch & Web Hosting:** Spun up an Amazon EC2 instance and deployed a static website.
- **AMI Creation:** Captured a custom Amazon Machine Image (AMI) from the configured instance to serve as a reusable golden image.
- **Cross-Account Sharing:** Shared the custom AMI with a peer to test collaborative and multi-account workflows.
- **Backup & Verification:** Launched a secondary instance from the shared AMI to verify configuration parity and high availability backup processes.
- **Resource Cleanup:** Terminated instances, deregistered the AMI, and deleted associated snapshots to follow cloud cost optimization best practices.

AWS AMI CREATION

The screenshot displays the AWS Management Console for the EC2 Instances page. The instance 'server-test' (i-0c5c217a8ea1558e9) is shown in the 'Running' state. The console provides details for this instance, including its public IP address (98.94.19.10) and public DNS (ec2-98-94-19-10.compute-1.amazonaws.com).

Name	Instance ID	Instance state	Instance type	Status check	Availability Zone	Public IPv4 DNS
server-test	i-0c5c217a8ea1558e9	Running	t3.micro	Initializing	us-east-1c	ec2-98-94-19-10.comp...

i-0c5c217a8ea1558e9 (server-test)

Instance summary

Instance ID	Public IPv4 address	Private IPv4 addresses	Instance state	Public DNS
